Cardiopulmonary resuscitation (CPR) is an emergency procedure that combines chest compressions often with artificial ventilation in an effort to manually preserve intact brain function until further measures are taken to restore spontaneous blood circulation and breathing in a person who is in cardiac arrest. It is recommended in those who are unresponsive with no breathing or abnormal ...

Supported. In the context of Apache HBase, /supported/ means that HBase is designed to work in the way described, and deviation from the defined behavior or functionality should be reported as a bug.

Apache HBase â„¢ Reference Guide

The return of consciousness without the return of a pulse is still rare, but may be more common with our increased focus on high quality chest compressions. There is still no evidence that interrupting chest compressions, for anything other than defibrillation, improves outcomes. Is this due to the consistency of the machine? Maybe. Maybe not.
