Combustion, or burning, is a high-temperature exothermic redox chemical reaction between a fuel (the reductant) and an oxidant, usually atmospheric oxygen, that produces oxidized, often gaseous products, in a mixture termed as smoke. Combustion in a fire produces a flame, and the heat produced can make combustion self-sustaining. Combustion is often a complicated sequence of elementary radical ...

An internal combustion engine (ICE) is a heat engine where the combustion of a fuel occurs with an oxidizer (usually air) in a combustion chamber that is an integral part of the working fluid flow circuit. In an internal combustion engine, the expansion of the high-temperature and high-pressure gases produced by combustion applies direct force to some component of the engine.

Remember that the pre-requisite of the flow arriving at the valve seat should be that the flow velocity at any rpm maintains atomization of the fuel (fuel remains suspended as a mist in the air and does not "rain out" in big droplets onto the cylinder head wall).The flow in the intake port should not separate and form vortices before it turns down into the combustion chamber.
