An artificial neural network is a network of simple elements called artificial neurons, which receive input, change their internal state (activation) according to that input, and produce output depending on the input and activation.. An artificial neuron mimics the working of a biophysical neuron with inputs and outputs, but is not a biological neuron model.

Artificial intelligence, defined as intelligence exhibited by machines, has many applications in today's society. More specifically, it is Weak AI, the form of A.I. where programs are developed to perform specific tasks, that is being utilized for a wide range of activities including medical diagnosis, electronic trading, robot control, and remote sensing.

Joone is a Java framework to build and run AI applications based on neural networks. Joone consists of a modular architecture based on linkable components that can be extended to build new learning algorithms and neural networks architectures.

As shown in Fig. 1, the neurons are restricted to form a bipartite graph in an RBM. It can be seen that there is a full connection between the visible units and the hidden ones, while no connection exists between units from the same layer. To train an RBM, the Gibbs sampler is adopted.

2.. Artificial neural networks An artificial neural network, is a biologically inspired computational model formed from hundreds of single units, artificial neurons, connected with coefficients (weights) which constitute the neural structure. They are also known as processing elements (PE) as they process information. Each PE has weighted inputs, transfer function and one output.
