This book started its life as my lecture notes for Math 444 at the University of Illinois at Urbana-Champaign (UIUC) in the fall semester of 2009, and was later enhanced to teach Math 521 at University of Wisconsin-Madison (UW-Madison). A prerequisite for the course is a basic proof course.

Three final examples: $x = x$ cannot be replaced by the boolean constant true, because it fails when x is a NaN; $-x = 0 - x$ fails for $x = +0$; and $x < y$ is not the opposite of $x > y$, because NaNs are neither greater than nor less than ordinary floating-point numbers.
