The ship's electrical network, engine control and automation

Marine propulsion is the mechanism or system used to generate thrust to move a ship or boat across water. While paddles and sails are still used on some smaller boats, most modern ships are propelled by mechanical systems consisting of an electric motor or engine turning a propeller, or less frequently, in pump-jets, an impeller. Marine engineering is the discipline concerned with the ...

MS Rotterdam Itinerary | Crew Center

Both engine types require fuel, and lots of it. For example, the QE2 consumes about 380 tons of fuel daily if it's traveling at a speed of 28.5 knots and carries enough fuel to sail nonstop for 12 days [source: Warwick]. Cruise ships usually fill up at various ports, using fueling barges like floating gas stations.
