A Rock Fragmentation Prediction Model for Mining Excavations

Slope stability analysis is performed to assess the safe design of a human-made or natural slopes (e.g. embankments, road cuts, open-pit mining, excavations, landfills etc.) and the equilibrium conditions. Slope stability is the resistance of inclined surface to failure by sliding or collapsing. The main objectives of slope stability analysis are finding endangered areas, investigation of ...

Rock Mass Classification The objectives of rock mass classifications are to: Identify the most important parameters influencing the rock mass. Divide a rock mass formation into groups of similar behaviour. Provide a basis for understanding the characteristics of each rock mass class. Relate experiences of rock conditions at one site to those at another.

Rock Engineering Practice & Design - ISRM

The mantle is a layer inside a planetary body bounded below by a core and above by a crust. Mantles are either made of rock or ices, and are generally the largest and most massive layer of the planetary body. Mantles are characteristic of planetary bodies that have undergone differentiation by density. The mantle is bounded on the bottom by the planetary core and on top by the crust.

Rock masses are commonly used as the underlying layer of important structures such as bridges, dams and transportation constructions. The success of a foundation design for such structures mainly depends on the accuracy of estimating the bearing capacity of rock beneath them.

New design equations for estimation of ultimate bearing

High-capacity, post-tensioned anchors have found wide-spread use, originally in initial dam design and construction, and more recently in the strengthening and rehabilitation of concrete dams to meet modern

design and safety standards.

A water-compatible variant of a click-like polymerization between alkynoates and secondary amines to form aminoacrylate synthetic polyethylene glycol (PEG) based hydrogels was developed. Cell culture experiments indicate cytocompatibility of these gels with >90 % viability retained in THP-1 and NIH/3T3 cells after 72 hours in culture.
