

exponential growth problems and pdf

Exponential growth is exhibited when the rate of change—the change per instant or unit of time—of the value of a mathematical function is proportional to the function's current value, resulting in its value at any time being an exponential function of time, i.e., a function in which the time value is the exponent.

Exponential decay occurs in the same way when the growth rate is negative.

Exponential growth - Wikipedia

in which the argument x occurs as an exponent. A function of the form $f(x) = a^x$ is also an exponential function, as it can be rewritten as $f(x) = e^{x \ln a}$. As functions of a real variable, exponential functions are uniquely characterized by the fact that the growth rate of such a function (that is, its derivative) is directly proportional to the value of the function.
