The Timoshenko beam theory was developed by Stephen Timoshenko early in the 20th century. The model takes into account shear deformation and rotational bending effects, making it suitable for describing the behaviour of thick beams, sandwich composite beams, or beams subject to high-frequency excitation when the wavelength approaches the thickness of the beam.

In applied mechanics, bending (also known as flexure) characterizes the behavior of a slender structural element subjected to an external load applied perpendicularly to a longitudinal axis of the element.. The structural element is assumed to be such that at least one of its dimensions is a small fraction, typically 1/10 or less, of the other two. When the length is considerably longer than ...

I am sure most here are familiar with the concept of shear flow as it related to horizontal shear stresses in beams. When designing a I-Shaped plate girder, most references, if not all, will design the weld between the flange and web using the shear formula  $VQ/I$  to determine the force on the welds.

Kruip is de blijvende vervorming van een materiaal dat gedurende langere tijd belast is met bijvoorbeeld trek- of drukkracht, of met een moment belast is. Kruip is doorgaans een ongewenst verschijnsel, en kan een beperkende factor zijn voor de levensduur van een object.
