In probability theory, a log-normal (or lognormal) distribution is a continuous probability distribution of a random variable whose logarithm is normally distributed. Thus, if the random variable X is log-normally distributed, then $Y = \ln(X)$ has a normal distribution. Likewise, if Y has a normal distribution, then the exponential function of Y , $X = \exp(Y)$, has a log-normal distribution.

In probability and statistics, an urn problem is an idealized mental exercise in which some objects of real interest (such as atoms, people, cars, etc.) are represented as colored balls in an urn or other container. One pretends to remove one or more balls from the urn; the goal is to determine the probability of drawing one color or another, or some other properties.

Welcome! Random is a website devoted to probability, mathematical statistics, and stochastic processes, and is intended for teachers and students of these subjects. The site consists of an integrated set of components that includes expository text, interactive web apps, data sets, biographical sketches, and an object library.

Student's t -distribution is defined as the distribution of the random variable which is (very loosely) the "best" that we can do not knowing μ . The Student's t -distribution with degrees of freedom is implemented in the Wolfram Language as StudentTDistribution[n]. If $n \rightarrow \infty$, and the distribution becomes the normal distribution. As n increases, Student's t -distribution approaches the normal distribution.

Basic Concepts. Definition 1: The Poisson distribution has a probability distribution function (pdf) given by. The parameter λ is often replaced by μ . A chart of the pdf of the Poisson distribution for $\lambda = 3$ is shown in Figure 1. Figure 1 is Poisson Distribution. Observation: Some key statistical properties of the Poisson distribution are: Mean = λ ...
