In nuclear physics and chemistry, the Q value for a reaction is the amount of energy absorbed or released during the nuclear reaction. The value relates to the enthalpy of a chemical reaction or the energy of radioactive decay products. It can be determined from the masses of reactants and products. Q values affect reaction rates. In general, the larger the positive Q value for the reaction ...

The nuclear force (or nucleon–nucleon interaction or residual strong force) is a force that acts between the protons and neutrons of atoms. Neutrons and protons, both nucleons, are affected by the nuclear force almost identically. Since protons have charge +1 e, they experience an electric force that tends to push them apart, but at short range the attractive nuclear force is strong enough to ...

These operators will operate on a wave function, Ψ , which is assumed to exist, and which is assumed to contain all that is knowable about the quantum mechanical system. We would then solve the resulting equation to get the particulars. And so, in this example, we can write the substitutions into the classical expression for total energy.

Geschiedenis van de kernfysica. De kernfysica ontwikkelde zich vanaf 1896 na de ontdekking van de radioactiviteit door Henri Becquerel en de ontdekking van het elektron door Joseph Thomson een jaar later. Thomson stelde aan het begin van de twintigste eeuw een atoommodel voor waarin de negatief geladen elektronen zich binnen het atoom vrij konden bewegen door een positief geladen pudding.

Die Bezeichnung Hadronen wurde 1962 von Lew Okun als Reaktion auf die Entdeckung immer neuer Teilchen, die der starken Wechselwirkung unterlagen, eingeführt. Zwei Jahre später postulierte Murray Gell-Mann die Existenz von Quarks, aus denen die Hadronen aufgebaut sind. Dies führte dazu, dass die Hadronen nicht mehr als Elementarteilchen angesehen werden.

Een atoomkern of nucleus bevindt zich in het centrum van een atoom of ion. De kern bestaat uit twee soorten nucleonen: de positief geladen protonen en de neutrale neutronen. Een nuclide is een atoomkernsoort. Het wordt bepaald door het aantal protonen en het aantal neutronen. Rondom de positief geladen kern bevindt zich een negatief geladen elektronenwolk. ...
