

soils and foundations solution pdf

The physical properties of soils, in order of decreasing importance for ecosystem services such as crop production, are texture, structure, bulk density, porosity, consistency, temperature, colour and resistivity. Soil texture is determined by the relative proportion of the three kinds of soil mineral particles, called soil separates: sand, silt, and clay.

Laterite is a soil and rock type rich in iron and aluminium, and is commonly considered to have formed in hot and wet tropical areas. Nearly all laterites are of rusty-red coloration, because of high iron oxide content. They develop by intensive and prolonged weathering of the underlying parent rock. Tropical weathering (laterization) is a prolonged process of chemical weathering which produces ...

Researchers sample along a transect at Taylor Glacier in Antarctica. [Hinrich Schaefer/Oregon State University] Ice Cores. This past summer, a giant iceberg broke off Antarctica's Larsen C ice shelf, a "calving" event that was reported in the media (by some of the same outlets that track tech product releases and celebrity news) as a symbol of imminent climate change.
